PRODUCT INFORMATION
PANAMAX

NAME OF THE MEDICINE
Non-proprietary Name
Paracetamol

DESCRIPTION
Tablets
Each tablet contains paracetamol 500 mg.
The inactive ingredients are: maize starch, purified talc, pregelatinised maize starch, povidone, stearic acid and potassium sorbate.

Elixir
Each 5 mL contains paracetamol 120 mg.
The inactive ingredients are: macrogol 1500, Brilliant Scarlet, propylene glycol, glycerol, tutti frutti flavour, raspberry flavour, benzoic acid, potassium sorbate, Lycasin, saccharin sodium and purified water.

240 Elixir
Each 5 mL contains paracetamol 240 mg.
The inactive ingredients are: macrogol 1500, allura red AC CI 16035, propylene glycol, glycerol, saccharin sodium, sorbitol solution, benzoic acid, potassium sorbate, raspberry flavour, imitation candied sugar and purified water.

PHarmacology
Paracetamol has analgesic and antipyretic effects.

Pharmacokinetics
Absorption
After oral administration, paracetamol is absorbed rapidly and completely from the small intestine; peak plasma levels occur 10 to 60 minutes after administration. Food intake delays paracetamol absorption.

Distribution
Paracetamol is uniformly distributed throughout most body fluids; the apparent volume of distribution is 1 to 1.2 L/kg. Paracetamol can cross the placenta and is excreted in breast milk. Plasma protein binding is negligible at usual therapeutic concentrations but increases with increasing concentrations.

Metabolism
Paracetamol is metabolised by the hepatic microsomal enzyme system. In adults at therapeutic doses, paracetamol is mainly conjugated with glucuronide (45-55%) or sulfate (20-30%). A minor proportion (less than 20%) is metabolised to catechol derivatives, and mercapturic acid compounds via oxidation. Paracetamol is metabolised differently by infants and children compared to adults, the sulfate conjugate being predominant.
Excretion
Paracetamol is excreted in the urine mainly as the glucuronide and sulfate conjugates. Less than 5% is excreted as unchanged paracetamol. 85-90% of the administered dose is eliminated in the urine within 24 hours of ingestion. The elimination half-life is about 1 to 4 hours.

INDICATIONS
Relief of pain and discomfort in arthritis, headache, muscular and neuralgic conditions. Reduces fever. Panamax is useful as an analgesic for patients with dyspepsia, ulcers or gout.

CONTRAINDICATIONS
Panamax is contraindicated in patients who are hypersensitive to paracetamol or to any other component of the Panamax formulations. It must not be used in patients with known glucose-6-phosphate-dehydrogenase deficiency or pre-existing respiratory depression. Panamax must not be used in patients with impaired liver function.

PRECAUTIONS
Panamax should not be administered to patients with hepatic or renal dysfunction (see CONTRAINDICATIONS). This medication may be dangerous when used in large amounts or for long periods. Hepatotoxicity may occur with paracetamol even at therapeutic doses, after short treatment duration and in patients without pre-existing liver dysfunction. Hepatotoxicity may develop following as little as 10 to 15g of paracetamol and hepatic failure is known to occur occasionally with the long term use of paracetamol.

To avoid the risk of overdose:
Check that paracetamol is absent from the composition of other medicinal products taken concomitantly.
Patients with known analgesic intolerance or known bronchial asthma must only use Panamax after having consulted a physician (hypersensitivity reactions including bronchospasm possible).
Caution is advised in patients with underlying sensitivity to aspirin and/or to non-steroidal anti-inflammatory drugs (NSAIDs).*
Severe cutaneous adverse reactions (SCARs): Life threatening cutaneous reactions Stevens-Johnson syndrome (SJS), and Toxic epidermal necrolysis (TEN) have been reported with the use of paracetamol. Patients should be advised of the signs and symptoms and monitored closely for skin reactions. If symptoms or signs of SJS and TEN (e.g. progressive skin rash often with blisters or mucosal lesions) occur, patients should stop paracetamol treatment immediately and seek medical advice.

Paracetamol should be used upon medical advice in patients with:
- severe renal insufficiency
- chronic alcohol use including recent cessation of alcohol intake
- low glutathione reserves
- Gilbert’s syndrome

Use in pregnancy
Category A - Drugs which have been taken by a large number of pregnant women and women of childbearing age without any proven increase in the frequency of malformations or other direct or indirect harmful effects on the foetus having been observed. Paracetamol can
be used during pregnancy if clinically needed however it should be used at the lowest effective dose for the shortest possible time and at the lowest possible frequency.

Paracetamol can cross the placenta; however, no teratogenic effects have been observed in rats or mice, after doses of up to 250 mg/kg.

A woman in the third trimester of pregnancy ingested 22.5 g paracetamol. Early treatment with oral acetylcysteine resulted in good outcome for both mother and foetus.

**Use in lactation**

Paracetamol is excreted in breast milk. The amount available for ingestion by the infant has been reported variously as less than 0.1% of a single 500 mg dose and as 0.04 to 0.23% of a single 650 mg dose. Maternal ingestion of paracetamol in usual analgesic doses does not appear to present a risk to the nursing infant.

**Effect on Laboratory Tests**

*Uric acid and blood glucose:* Intake of paracetamol may affect the laboratory determination of uric acid by phosphotungstic acid and of blood glucose by glucose oxidase-peroxidase.

**INTERACTIONS WITH OTHER MEDICINES**

Paracetamol may increase the risk of bleeding in patients taking warfarin and other antivitamin K. Anticoagulant dosage may require reduction and patients should be monitored for appropriate coagulation and bleeding complications.

Paracetamol absorption is increased by drugs which increase gastric emptying e.g. metoclopramide and domperidone and decreased by drugs which decrease gastric emptying e.g. propantheline, antidepressants with anticholinergic properties, narcotic analgesics.

Paracetamol may increase chloramphenicol concentrations by slowing down excretion, entailing the risk of increased toxicity. The risk of paracetamol toxicity may be increased in patients receiving other potentially hepatotoxic drugs or drugs that induce liver microsomal enzymes, such as antiepileptics (such as phenobarbital, phenytoin, carbamazepine, topiramate), barbiturates, hypnotics, rifampicin and alcohol.

Paracetamol excretion may be affected and plasma concentrations altered when given probenecid.

Cholestyramine reduces the absorption of paracetamol if given within 1 hour of paracetamol. Chelating resin can decrease the intestinal absorption of paracetamol and potentially decrease its efficacy if taken simultaneously. In general, there must be an interval of more than 2 hours between taking the resin and taking paracetamol, if possible.

Co-administration of flucloxacinil with paracetamol may lead to metabolic acidosis, particularly in patients presenting risk factors of glutathione depletion, such as sepsis, malnutrition or chronic alcoholism.

When used concurrently with zidovudine, an increased tendency for neutropenia may develop. Combination of Panamax and zidovudine should be avoided.

**ADVERSE REACTIONS**

Reports of adverse reactions are rare. Although the following reactions have been reported: dyspepsia, sweating, erythema, urticaria, anaphylactic shock, angioneurotic oedema, difficulty breathing, drop in blood pressure, nausea, allergic reactions such as skin rashes, hypersensitivity reactions and haematological reactions, including thrombocytopenia, leukopenia, neutropenia, agranulocytosis and pancytopenia. Bronchospasm may be triggered in patients having a tendency of analgesic asthma. Toxic epidermal necrolysis (TEN), Stevens-Johnson syndrome (SJS), acute generalised exanthematous pustulosis, fixed drug eruption (see PRECAUTIONS) and cytolytic hepatitis, which may lead to acute hepatic failure, have also been reported. Overdosage with paracetamol if left untreated can result in severe, sometimes fatal liver damage and rarely, acute renal tubular necrosis.
Haemolytic anaemia in patients with underlying glucose 6-phosphate-dehydrogenase deficiency has been reported. Kounis syndrome and bronchospasm have also been reported.

**DOSAGE AND ADMINISTRATION**

**Tablets**

**Children**

7 to 12 years: 250 to 500 mg (1/2 to 1 tablet) every four to six hours (maximum 4 tablets per day). Take with water.

**Adults**

500 mg to 1g (1 to 2 tablets) every four to six hours (maximum 8 tablets per day). Take with water.

**Elixir**

Administer in water or fruit juice at 4 to 6-hourly intervals.

**Infants**

1 to 3 months: (4–6 kg) 2 to 4 mL;
3 to 6 months: (6–8 kg) 4 to 5 mL;
6 to 12 months: (8–10 kg) 5 to 6 mL.

**Children**

1 to 2 years: (10–12 kg) 6 to 8 mL;
2 to 4 years: (12–16 kg) 8 to 10 mL;
4 to 6 years: (16–20 kg) 10 to 13 mL;
6 to 8 years: (20–25 kg) 13 to 16 mL;
8 to 10 years: (25–32 kg) 16 to 20 mL;
10 to 12 years: (32–41 kg) 20 to 26 mL.
Administration to infants under 1 month is not recommended. Recommended dosages are based on 15 mg of paracetamol per kg of body weight.

**240 Elixir**

Administer in water or fruit juice if necessary.

**Children**

5 to 6 years: (18–20 kg) 6 mL;
6 to 8 years: (20–25 kg) 6 to 8 mL;
8 to 10 years: (25–32 kg) 8 to 10 mL;
10 to 12 years: (32–41 kg) 10 to 12 mL.

**Adults**

10 to 20 mL (maximum 80 mL per day)
If necessary repeat 4 to 6 hourly up to 4 times in 24 hours.
Panamax 240 Elixir is not recommended for children under 5 years of age.
OVERDOSAGE

Elderly persons, small children, patients with liver disorders, chronic alcohol consumption or chronic malnutrition, as well as patients concomitantly treated with enzyme-inducing drugs are at an increased risk of intoxication, including fatal outcome.

Symptoms

Toxic symptoms include vomiting, abdominal pain, hypotension and sweating. Nausea, vomiting, anorexia, pallor and abdominal pain generally appear during the first 24 hours of overdose with paracetamol. Overdosage with paracetamol may cause hepatic cytolysis which can lead to hepatocellular insufficiency, gastrointestinal bleeding, metabolic acidosis, encephalopathy, coma and death. Increased levels of hepatic transaminases, lactate dehydrogenase and bilirubin with a reduction in prothrombin level can appear 12 to 48 hours after acute overdose. Overdosage can also lead to pancreatitis, acute renal failure and pancytopenia. The most serious adverse effect of acute overdosage of paracetamol is a dose-dependent, potentially fatal hepatic necrosis. In adults, hepatotoxicity may occur after ingestion of a single dose of 12 g (24 tablets) of paracetamol; a dose of 25 g (50 tablets) or more is potentially fatal. Symptoms during the first 2 days of acute poisoning by paracetamol do not reflect the potential seriousness of the intoxication. Major manifestations of liver failure such as jaundice, hypoglycaemia and metabolic acidosis may take at least 3 days to develop.

Treatment

Despite lack of significant early symptoms, patients should be referred to hospital urgently for immediate medical attention.

Determinations of the plasma concentration of paracetamol are recommended.

Plasma concentration of paracetamol should be measured at 4 hours or later after ingestion (earlier concentrations are unreliable).

Where paracetamol intoxication is suspected, intravenous administration of SH group donors such as acetylcysteine within the first 10 hours after ingestion is indicated. Although acetylcysteine is most effective if initiated within this period, it can still offer some degree of protection if given as late as 48 hours after ingestion; in this case it is taken for longer.

If the history suggests that 12 g paracetamol or more has been ingested, administer one of the following antidotes:

Acetylcysteine 20% iv

Administer intravenously, 20% acetylcysteine immediately without waiting for positive urine test or plasma level results. For dosage instructions refer to the acetylcysteine 20% iv product information.

Oral Methionine

For dosage instructions refer to the methionine product information.

Further measures will depend on the severity, nature and course of clinical symptoms of intoxication and should follow standard intensive care protocols.

For information on the management of overdose, contact the Poison Information Centre on 131126 (Australia).
