

PRODUCT INFORMATION

TRENTAL[®] 400

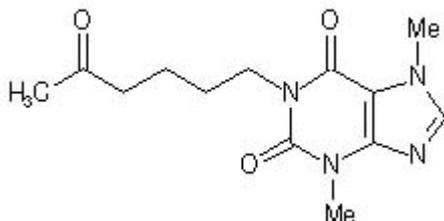

NAME OF THE DRUG

Australian Approved Name

Oxpentifylline

Oxpentifylline and Pentoxifylline are interchangeable and refer to the same molecule.

Chemical Structure

C₁₃H₁₈N₄O₃ 278.3102

CAS Number

6493-05-6

DESCRIPTION

A trisubstituted xanthine derivative designated chemically as 1-(5-oxohexyl)-3,7-dimethylxanthine, IUPAC name: 3,7-dimethyl-1-(5-oxohexyl)-3,7-dihydro-1H-purine-2,6-dione. Oxpentifylline is soluble in water and ethanol, and sparingly soluble in toluene.

Trental 400 controlled-release tablets also contain the following excipients: hydroxyethylcellulose, povidone, talc-purified, magnesium stearate, hypromellose, titanium dioxide, erythrosine, and macrogol 8000.

PHARMACOLOGY

Site and Mode of Action

It is thought that oxpentifylline and its metabolites improve the flow properties of blood by decreasing its viscosity. In patients with chronic peripheral arterial disease, this increases blood flow to the affected microcirculation and enhances tissue oxygenation. Some of the mechanisms by which this is thought to occur include dose-related haemorrhheological effects, such as decreased blood viscosity, improved erythrocyte flexibility, decreased plasma fibrinogen and enhanced platelet deaggregation. However, the precise mode of action of oxpentifylline and the sequence of events leading to clinical improvement are still to be clearly defined.

Pharmacokinetics

After oral administration in aqueous solution oxpentifylline is almost completely absorbed. It undergoes a first-pass effect and the various metabolites appear in plasma very soon after dosing.

Peak plasma levels of the parent compound and its metabolites are reached within 1 hour. The major metabolites are Metabolite I (1-[5-hydroxy-hexyl]-3,7-dimethylxanthine) and Metabolite V (1-[3-carboxypropyl]-3,7-dimethylxanthine), and plasma levels of these metabolites are 5 and 8 times greater, respectively, than of oxpentifylline. Following oral administration of aqueous solutions containing 100 to 400 mg of oxpentifylline, the pharmacokinetics of the parent compound and Metabolite I are dose-related and not proportional (non-linear), with half-life and area under the blood-level time curve (AUC) increasing with dose. The elimination kinetics of Metabolite V are not dose-dependent. The apparent plasma half-life of oxpentifylline varies from 0.4 to 0.8 hours and

the apparent plasma half-lives of its metabolites vary from 1 to 1.6 hours. There is no evidence of accumulation or enzyme induction (cytochrome P450) following multiple oral doses.

Excretion is almost totally urinary: the main biotransformation product is Metabolite V. Essentially no parent drug is found in the urine. Despite large variations in plasma levels of parent compound and its metabolites, the urinary recovery of Metabolite V is consistent and shows dose proportionality. Less than 4% of the administered dose is recovered in faeces. Food intake shortly before dosing delays absorption of an immediate release dosage form but does not affect total absorption. The pharmacokinetics and metabolism of Trental 400 have not been studied in patients with renal and/or hepatic dysfunction, but AUC was increased and elimination rate decreased in an older population (60-68 years) compared to younger individuals (22-30 years). After administration of the 400 mg controlled-release Trental 400 tablet, plasma levels of the parent compound and its metabolites reach their maximum within 2 to 4 hours and remain constant over an extended period of time. The controlled release of oxpentifylline from the tablet eliminates peaks and troughs in plasma levels for improved gastrointestinal tolerance.

INDICATIONS

The treatment of patients with intermittent claudication on the basis of chronic occlusive arterial disease of the limbs. Trental 400 can thus improve function and symptoms but is not intended to replace more definitive therapy, such as vascular surgery, or removal of arterial obstructions when treating peripheral vascular disease.

CONTRAINDICATIONS

Patients who have previously exhibited intolerance to this product; other methylxanthines such as caffeine, theophylline, and theobromine; or any of the excipients of Trental 400.

Trental 400 should not be given to patients with recent or severe haemorrhage, e.g. massive retinal haemorrhage, cerebral haemorrhage, acute myocardial infarction or patients with peptic ulcer or a recent history thereof.

PRECAUTIONS

Since oxpentifylline is extensively metabolised in the liver and eliminated through the kidneys, the use of this drug is not recommended in patients with marked impairment of kidney or liver function. Patients with less severe impairment of these organs should be closely monitored during Trental 400 therapy and may require lower doses.

Patients with chronic occlusive arterial disease of the limbs frequently show other manifestations of arteriosclerotic disease. Trental 400 has been used safely for treatment of peripheral arterial disease in patients with concurrent coronary artery and cerebrovascular diseases, but there have been occasional reports of angina, hypotension, and arrhythmia. Controlled trials do not show that Trental 400 causes such adverse effects more often than placebo, but, as it is a methylxanthine derivative, it is possible that some individuals will experience such responses. Careful monitoring is required in patients with acute arrhythmias or in patients with myocardial infarction.

Caution should be exercised and careful monitoring undertaken when administering Trental 400 to patients with low or labile blood pressure, for example patients with severe coronary heart disease or relevant stenoses of blood vessels supplying the brain. In such patients any dose increase should be done gradually.

Trental 400 should be used with caution in elderly patients as peak plasma levels of oxpentifylline and its metabolites are moderately higher in this age group. Elderly patients had a slight increase in the incidence of some adverse effects. Careful dose adjustment is therefore recommended.

Hypersensitivity reactions such as pruritus, rashes and urticaria do occur but progression to anaphylactoid shock and angioedema are rare. At the first signs of an anaphylactic/anaphylactoid reaction, Trental 400 must be discontinued, and a physician must be informed.

Careful monitoring and adjustment (see 'Dosage and Administration') are necessary in patients with impaired renal function (creatinine clearance below 30 mL/min).

Trental 400 may exacerbate bleeding; careful patient selection and monitoring of at risk patients via haematocrit and/or haemoglobin determinations are recommended.

Particular careful monitoring is required in patients treated concomitantly with anti-vitamin K, platelet aggregation inhibitors, antidiabetic agents or ciprofloxacin.

Use in Pregnancy

Pregnancy Category B1.

In teratogenic studies in rats and rabbits, oral doses of Trental 400 up to 25 and 10 times the maximum recommended human daily dose caused no foetal malformation. Increased resorption was seen in rats at high doses. However, since no well-controlled studies in pregnant women have been carried out, Trental 400 should not be used in pregnancy unless clearly needed.

Use in Lactation

Trental 400 and its metabolites are excreted in human milk. A decision should therefore be made whether to discontinue breast-feeding or discontinue the medicine, taking into account the importance of the medicine to the mother.

Paediatric Use

Safety and effectiveness in children below the age of 18 years have not been established.

Carcinogenicity

Long-term (18 month) studies to determine any carcinogenic potential of oxpentifylline have been conducted in mice and rats. No carcinogenic potential for oxpentifylline was noted in the mouse study. In the rat study, there was a statistically significant increase in benign mammary fibroadenomas in females in the high dose group. The relevance of this finding to human use is uncertain since this was only a marginal statistically significant increase for a tumour that is common in aged rats.

Genotoxicity

Oxpentifylline was devoid of mutagenic activity in various strains of Salmonella (Ames test) when tested in the presence and absence of metabolic activation.

INTERACTIONS WITH OTHER MEDICINES

There have been reports of bleeding (eg. skin, mucosa, gastrointestinal tract) and/or prolonged prothrombin time in patients treated with Trental 400 with and, rarely, without anticoagulants or platelet aggregation inhibitors. Patients on warfarin should have more frequent monitoring of prothrombin times, while patients with other risk factors complicated by haemorrhage (eg., recent surgery, peptic ulceration) should have periodic examinations for bleeding including haematocrit and/or haemoglobin.

Trental 400 has been used concurrently with digitalis and antiarrhythmics without observed problems. Small decreases in blood pressure have been observed in some patients treated with Trental 400. Periodic systemic blood pressure monitoring is recommended for patients receiving Trental 400 concomitantly with antihypertensive medicines, beta blockers, diuretics and other medicines with blood pressure lowering potential as their blood pressure lowering effects may be increased. If indicated, dosage of the antihypertensive agents should be reduced.

Combined use with other xanthines or with sympathomimetics may cause excessive CNS stimulation.

An increase in levels of theophylline and therefore an increase in the intensity and frequency of adverse events associated with theophylline may result from concomitant use with Trental 400.

Concomitant administration with ciprofloxacin may increase the serum concentration of pentoxifylline in some patients. Therefore, there may be an increase in and intensification of adverse effects associated with co-administration.

The blood sugar lowering effect of insulin or oral antidiabetics may be potentiated. In patients treated with hypoglycaemic agents, a moderate decrease in the dose of these agents may be required when Trental 400 is prescribed. Patients undergoing such therapy should be monitored closely.

Post-marketing cases of increased anti-coagulant activity have been reported in patients concomitantly treated with oxpentifylline and anti-vitamin K. Monitoring of anti-coagulant activity in these patients is recommended when oxpentifylline is introduced or the dose is changed.

Potential additive effect with platelet aggregation inhibitors. Due to the increased risk of bleeding, the concomitant administration of a platelet aggregation inhibitor with oxpentifylline should be undertaken with caution.

Concomitant administration with cimetidine may increase the plasma concentration of oxpentifylline and the active Metabolite I.

Effect on Laboratory Tests

Urinary assays for pregnanediol may show false positive results in the presence of oxpentifylline and its metabolites.

ADVERSE EFFECTS

Clinical trials with Trental 400 have been conducted in Australia, the United States and in Europe. The slow release formulation, Trental 400, was used in studies in Australia and Europe, while in the United States; studies were conducted using the capsule formulation, containing 200 mg oxpentifylline. In these studies, dosages used were 400 mg (tablets) two to three times daily or 200 mg - 400 mg (capsules) three times daily. Treatment periods for studies with Trental 400 ranged up to 60 weeks. The following adverse effects have been reported in clinical trials or post-marketing.

Gastrointestinal

The most frequent (greater than 1% incidence) types of side effects seen with Trental (all formulations) were gastrointestinal upsets, including nausea, dyspepsia, vomiting, belching/flatulence/bloating, abdominal pain, epigastric discomfort and diarrhoea. However, the controlled release preparation of Trental 400 resulted in much fewer gastrointestinal side effects, the most common being dyspepsia 2.8% (placebo 4.7%), nausea 2.2% (placebo 0.8%), vomiting 1.2% and belching/flatulence/bloating (0.6%). Anorexia, cholecystitis, constipation and a dry mouth/thirst have been reported with a frequency of less than 1%.

Central Nervous System

Side effects related to C.N.S. disturbances with an incidence of greater than 1% included dizziness, headache, insomnia and sleep disturbances and disorders, blurred vision, agitation/nervousness, drowsiness and tremor. Of these, the following were reported for the controlled release preparation Trental 400: dizziness 1.9% (placebo 3.1%), headache 1.2% (placebo 1.6%) and tremor 0.3% (placebo 0.8%). Anxiety and confusion have been reported with a frequency of less than 1%. Isolated cases of aseptic meningitis have been reported.

Cardiovascular

Only angina/chest pain was reported for Trental 400 tablets, with an incidence of 0.3%, while for the capsule formulation flushing and arrhythmia/palpitation/tachycardia were also reported, with an incidence of greater than 1%. Reports of hypotension were rare (<0.1%). Dyspnea and oedema have been reported with a frequency of less than 1%. Haemorrhage has also been reported (frequency unknown).

Hepatic

Isolated cases of intrahepatic cholestasis and jaundice as well as hepatitis and transaminase elevation have been reported.

Haemic and Lymphatic

Decreased fibrinogen, pancytopenia, purpura, aplastic anaemia, neutropenia and leukopenia. Isolated cases of thrombocytopenia have been noted.

Respiratory

Epistaxis, flu-like symptoms, laryngitis and nasal congestion have been reported rarely.

Hypersensitivity

Anaphylactic and anaphylactoid reactions have been reported. Pruritus, rashes and urticaria may occur with a frequency of 0.1% to 1% but progression to anaphylactoid shock (angioedema, bronchospasm) occurs only in isolated cases. Erythema (reddening of the skin) has been reported at an unknown frequency.

Miscellaneous

Rarely, the following were reported: brittle fingernails, blurred vision, conjunctivitis, earache, scotoma, bad taste in the mouth, excessive salivation, malaise, sore throat, swollen neck glands, weight change.

DOSAGE AND ADMINISTRATION

The usual dosage of Trental 400 in controlled-release tablet form is one tablet (400 mg) three times a day with or after meals, to be swallowed whole with some liquid. While the effect of Trental 400 may be seen within 2 to 4 weeks, it is recommended that treatment be continued for at least 8 weeks. Efficacy has been demonstrated in double-blind clinical studies of 6 months' duration.

Digestive and central nervous system side effects are dose related. If patients develop these side effects it is recommended that the dosage be lowered to one tablet twice a day (800mg/day). If side effects persist at this lower dosage, the administration of Trental 400 should be discontinued.

In patients with low or labile blood pressure or hepatic dysfunction, an individual dosage adjustment is required. This also applies to patients with renal dysfunction (creatinine clearance of less than 30 mL/min) where, according to individual tolerance, a dosage adjustment of 30 to 50% may be necessary.

OVERDOSAGE

Overdosage with Trental 400 has been reported in children and adults.

Symptoms

Symptoms appear to be dose related. A report from a poison control centre on 44 patients taking overdoses of enteric-coated oxpentifylline tablets noted that symptoms usually occurred 4-5 hours after ingestion and lasted about 12 hours. The highest amount ingested was 80 mg/kg; flushing, hypotension, convulsions, somnolence, loss of consciousness, fever, and agitation occurred. All patients recovered.

Initial symptoms of acute overdose with oxpentifylline may be nausea, dizziness, tachycardia or a fall in blood pressure. Signs such as fever, agitation, flushing, loss of consciousness, areflexia, tonic-clonic convulsions and coffee-ground vomiting (indicating gastrointestinal bleeding) may occur.

Treatment

In addition to symptomatic treatment special attention must be given to supporting respiration, maintaining systemic blood pressure, and controlling convulsions. Activated charcoal may reduce absorption of the medicine if given within one or two hours after ingestion. In patients who are not fully conscious or have impaired gag reflex, consideration should be given to administering activated charcoal via nasogastric tube, once the airway is protected.

Contact the Poisons Information Centre on 13 11 26 (Australia) for advice on management of overdosage.

PRESENTATION AND STORAGE CONDITIONS

Trental 400 is available as 400 mg pink, film-coated tablets, in blister packs of 50 tablets for oral administration. Trental 400 tablets are a controlled release formulation.

Store below 25°C. Protect from light.
